CLEAN VERSION OF CLAIMS WITH AMENDMENTS

CLAIMS

What is claimed as being new and desired to be protected by
LETTERS PATENT of the United States is as follows:

1. (Canceled)
2. (Canceled)
3. (Canceled)
4. (Canceled)
5. (Canceled)
6. (Canceled)

1. (Amended) A sexual aid system for increasing
stimulation during sex acts comprising, in combination:

a cylindrical shaft having a central long axis with a length
of between about 2 1/2 and 3 1/2 inches, the shaft having a first
end and a second end and an intermediate cylindrical portion
therebetween, the intermediate portion having a diameter of
between about 3/8 and 5/8 inches;

a base integrally formed at the first end of the shaft, the
base having a first curved face adjacent the first end of the
shaft and having diameter of between about 2 1/2 inches and 3 1/2
inches, ~~preferably 3 inches~~ and a flat second surface opposite
the first surface wherein the second surface includes a spin
assisting component formed of a recess and a laterally displaced

knob formed integrally therein, the recess and knob each having a short axis parallel with the long axis;

a plurality of raised nubs formed on the first surface of the base; and

A1
B a conical head integrally formed at the second end of the shaft, the conical head having a diameter of between about 1/4 inches and 1 3/4 inches, ~~preferably 1 1/2 inches~~ and having a plurality of ridge-like protrusions formed thereon, the shaft and base and conical head being fabricated of a generally lubricious glass-based material containing an appreciate amount of an oxide of boron to render it lubricious and resistant to heat, chemicals and electricity.

8. (Canceled)

29. A sexual aid system for increasing stimulation during sex acts comprising, in combination:

a cylindrical shaft, the shaft having a first end and a second end and an intermediate cylindrical portion therebetween;

A2 a base integrally formed at the first end of the shaft, the base having a first curved face adjacent the first end of the shaft and a flat second surface opposite the first surface wherein the second surface includes a spin assisting component formed integrally therewith;

a plurality of raised nubs formed on the first surface of the base;

a conical head is integrally formed at the second end of the shaft; and

A²
the shaft and base and conical head being fabricated of a generally lubricious glass-based material containing an appreciable amount of an oxide of boron to render it lubricious and resistant to heat, chemicals and electricity.

3¹⁰. The system as set forth in Claim ²/₉ wherein the spin assisting component is a recess in a cylindrical configuration parallel with, but offset from, the cylindrical shaft.

A³
⁴/₁₁. The system as set forth in Claim ²/₉ wherein the spin assisting component is a knob in a cylindrical configuration parallel with, but offset from, the cylindrical shaft.

⁵/₁₂. The system as set forth in Claim ²/₉ wherein the spin assisting component is a recess in a cylindrical configuration and a laterally displaced knob formed integrally therewith, the recess and knob each having a short axis parallel with the long axis.
